

Both scripts now use space-separated KEY=VALUE tokens. Any number of them is fine. Values cannot contain spaces.

Encrypt:

Bash

```
./pwencrypt.sh ACCESS_KEY_ID=AKI... SECRET_ACCESS_KEY=wJal... F00=bar  
# or  
echo 'ACCESS_KEY_ID=AKI... SECRET_ACCESS_KEY=wJal... F00=bar' |  
./pwencrypt.sh
```

That prints one base64 line. Paste it into the blob heredoc in pwdecrypt.sh .

Decrypt (source so names exist in this shell):

Bash

```
source ./pwdecrypt.sh  
echo "$ACCESS_KEY_ID"
```

The blob already in pwdecrypt.sh is still the old | -separated payload. Re-encrypt with spaces and replace the heredoc, or decrypt will not split correctly.

Old format (A=1 | B=2) and new format (A=1 B=2) are not interchangeable
